

In 1989 I was a consultant for Marplex Limited in Dandenong...

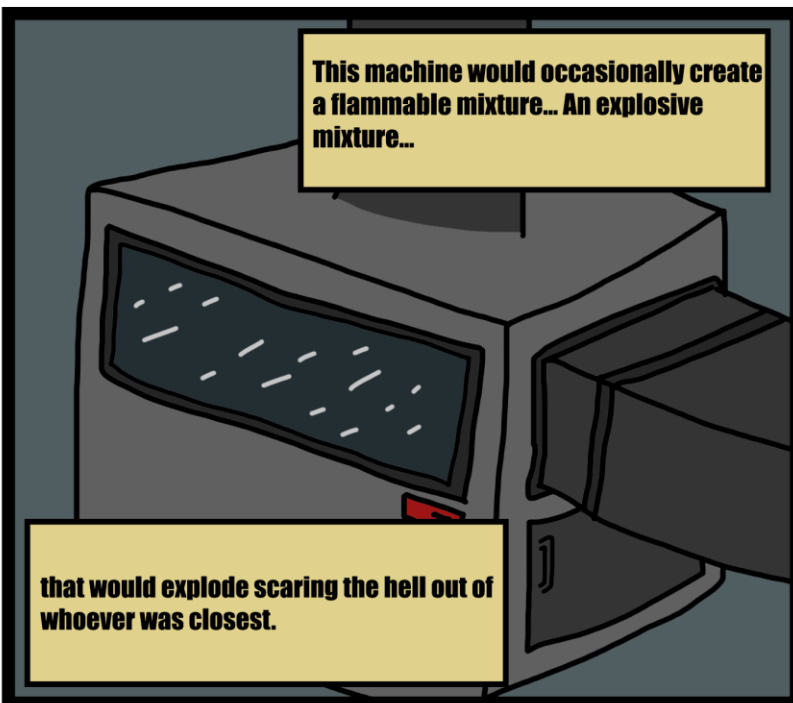

working on an air emissions control project

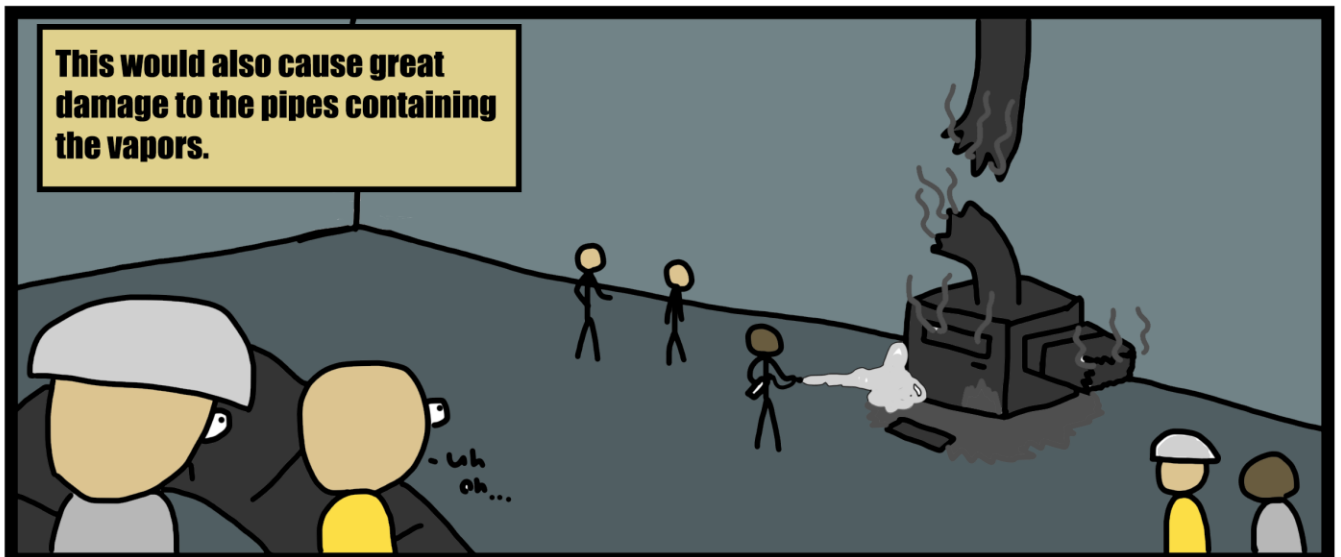

One of the machines would incinerate the air emissions made from plastics.

This machine would occasionally create a flammable mixture... An explosive mixture...

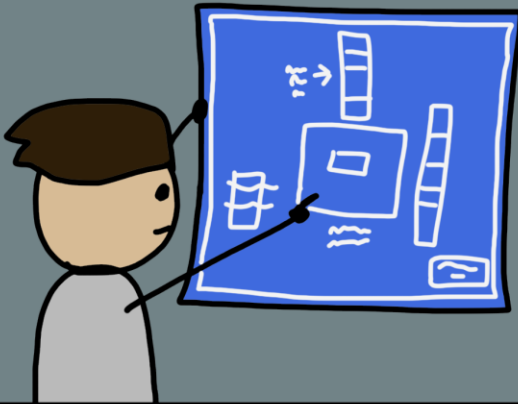

that would explode scaring the hell out of whoever was closest.

This would also cause great damage to the pipes containing the vapors.

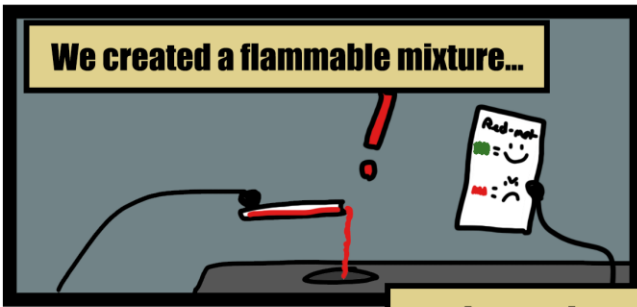

I created an explosion relief system that consisted of reinforced vents held down by sturdy chains

And so when we tested my design all the factory managers, local politicians and important people were watching

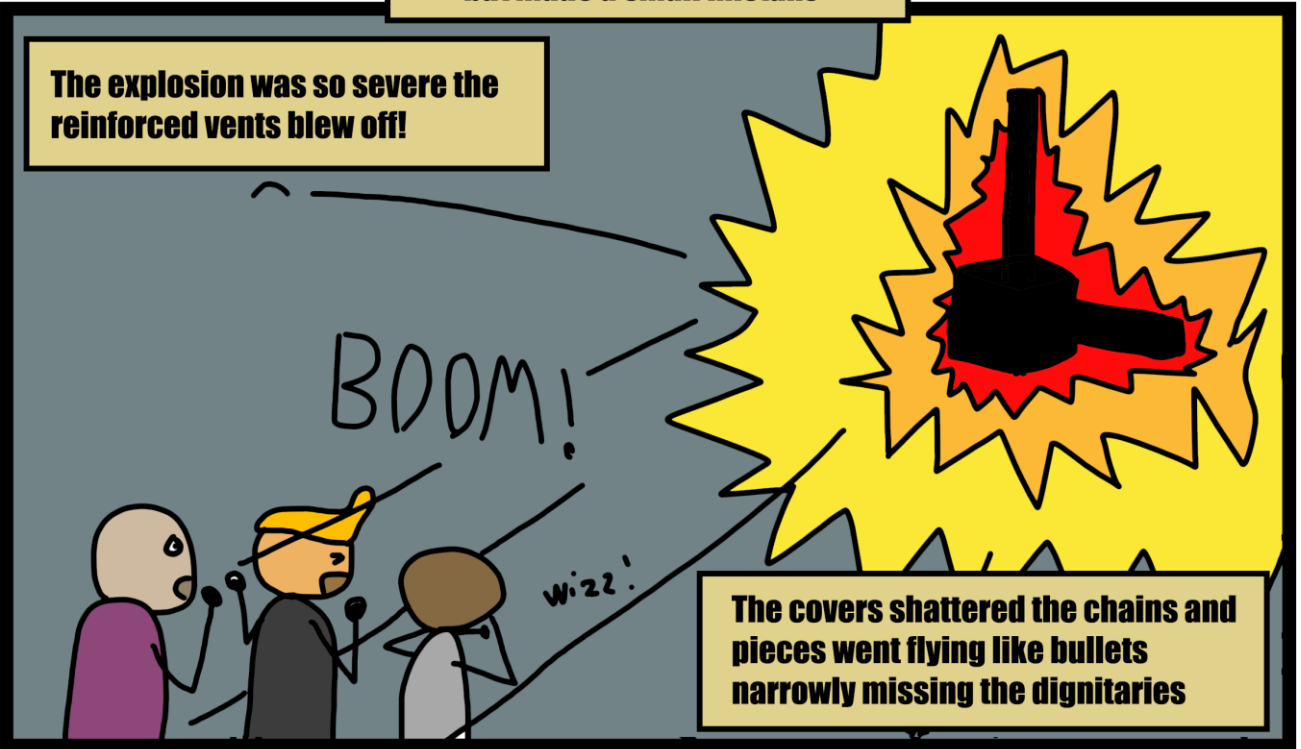

We created a flammable mixture...

but made a small mistake

The explosion was so severe the reinforced vents blew off!

The covers shattered the chains and pieces went flying like bullets narrowly missing the dignitaries

I was worried that I would've been reprimanded for this but

Everyone laughed it off...

Although if one of those chain pieces had hit someone it would've probably played out a lot differently...
